	Would you like more detail on any of these engines?	
b. What assumptions did the answers make?	- Assumed I knew lots of the technical terminology in its response by default - Assumed I wanted a list of a bunch of game engines with no preference in what kind of game or coding language I want to use	- Assumed I wanted the most popular ones out there primarily - Did not assume how experienced I was in making video games, so it offered some that are very easy for beginners to learn
c. Are their ethical considerations? If so, which assistant did better on them?	- Could be biased towards Unity, as it calls it "most flexible and accessible engine" - Forgets to mention Unreal Engines royalty fee Assistant B did better because it explains the pricing of each game engine and provides beginner friendly options. It lets me choose based on my needs and skills.	- Could be more biased towards popular game engines, as it starts by mentioning the "Big Three" - May be considerate of my coding ability as shown by its labeling of the beginner-friendly game engines Assistant B did better because it explains the pricing of each game engine and provides beginner friendly options. It lets me choose based on my needs and skills.

d. Which result did you like better and why?

Assistant B was better. It organizes information around making decisions, takes skill into consideration, and includes real game examples.

e. Is the AI trustworthy here over automated alternatives (e.g., search engine)?

I think a search engine would be better than the AIs. Both AIs started by explaining the most popular game engines, when a search engine could list many lesser known engines aside from Unity, Unreal, and Godot.
